Project Overview

Goat-Viz is an interactive, data-driven visualization platform designed to settle the “Greatest of All Time” debate by bridging the gap between disparate sports. By aggregating and normalizing statistics from legendary athletes across football, boxing, and chess, the system transforms subjective arguments into evidence-based exploration. Users can engage with multi-dimensional views—including bubble plots, radar charts, and parallel coordinates—to compare dominance, longevity, and impact across eras. Most notably, the platform empowers users to define their own criteria through a customizable weighting system, dynamically calculating a personalized “GOAT score” that accounts for championships, individual accolades, and other metrics.

GenAI Prompts

- I want to be able to drag the parallel coordinate instead of the arrows on their labels. There should be a visual indication that they are dragable.
- The parallel coordinate dragging is no longer functional; When holding the mouse button, the drag action is cancelled
- Can you take this dataset and enhance it with the above metrics for each athlete, make the metrics as accurate as possible to the corresponding atlhete based on there real performance during matches, according to stats and history
- I want you to make the dataset for me across three sports. Football, Chess and Boxing, I want you first to come up with the schema for what data to track for each sport. The schemas can be speifir cfor each sport and does not have to be uniform across the three sports. Output should be in the form of JSON
- Career Timeline I want it so that when you click on the star you can see what award/title was won: marks major awards / titles. Breaks in lines indicate missing year data.
- Isolate variables used in the charts from hardcoded values and bind them to the slide-bar values
- Add an experimental stage where a stacked bar chart is used to represent the values of each category and the overall score, with filtering and grouping categories
- add a weighted score for the sports for each category such that they are in −1 to 1 and add up to 0.
